

# Model View Controller (mvc)

Example → Restaurant

↓  
It is the actual  
frontend that  
the end user sees  
and do some  
actions

↓  
then act as the  
first line of defen  
i.e. they read the  
request sent by  
user & forward  
it to models.

↓  
these contain  
core business  
logic/service  
and database  
activities

API

## Command

- models → logic of models.
- Controllers → logic of controllers
- routes → route urls, & on which route what controller hit
- config → add db configs & server config

(route ↔ controller) mapping

In the routes we basically mention the URL,  
http method

CRUD

Write down 1 api routes with url & http method  
for categories:

web app → ecom/api/v1/

versions

v2

v3

v1 → v2

```
CREATE TABLE Category (id int NOT NULL  
AUTO_INCREMENT, name varchar(255) NOT NULL,  
description varchar(255), created_at datetime NOT  
NULL, updated_at datetime NOT NULL, PRIMARY KEY  
(id));
```
